USAGE	Used for the compaction of all types of soil.	

IMPORTANT NOTES:

- Compaction is used to increase the density of materials by two methods:
 1. Static force.
 2. Vibratory (dynamic force)
- Compaction costs approx. 4% of the total construction cost. It is very important for the quality of the finished structures. It is often ignored which results in cracks & high maintenance costs.
- Compaction depends of the type of soil, moisture (water content), the compaction method & the performance of the compaction / vibration equipment.

IMPORTANT NOTES:

- All our Forklifts are fitted with side shifter attachment to simplify loading / unloading.
- The above Forklift names are as per the manufacturers sizes and apply only to the rated lift capacities with a standard 2 stage, 3 meter masts at 600mm load center fitted with 1220mm forks and without side shifter attachment.
- The lifting capacities become less due to the 3 stage longer Masts, the side shifter, the longer forks, and for higher load centres.
- Care must be exercised when handling elevated loads as the forklift stability is reduced. It is important that mast tilt in either direction is kept to a minimum when loads are raised.
